

The centrifuge is an effective and proven piece of equipment for dewatering the solids skimmed off most DAF wastewater systems, which are typically wet, sloppy, and expensive to handle. With disposal issues and costs increasing the centrifuge provides these cost saving advantages:

- Reduces total disposal volume by as much as 70%
- Produces stackable cake like sludge
- Reduces handling costs
- Increases options for sludge disposal

With the widest range of available liquid / solid separating centrifuges and process options in the industry, US Centrifuge can help you realize the above benefits.

Please call or e-mail with the following information and one of our application specialist will give you a quick assessment of whether it will work for you.

- How much DAF sludge volume does your plant produce?
- What does it cost to dispose of your DAF Sludge?

Results from CQ Decanter Centrifuge on chicken wastewater DAF Sludge:

Above Photos illustrating:

- Test rig installation on DAF
- Separated DAF sludge solids in disposal hopper
- DAF liquid sludge sample before centrifugation
- DAF liquid sludge sample after centrifugation
